Netflix Catalog Data Exploration

What 8,807 titles reveal about catalog mix, growth, geography, genres, and audience targeting

5 MINUTES

6-SLIDE STORY

Independent Data Exploration

By : Aparna Raveendran Nair Remadevi

From raw catalog data to an analytical story

Cleaning choices protected useful records while making dates and durations comparable.

1

Inspect

8,807 rows, 12 fields

2

Clean

Duplicates, whitespace, missing values

3

Transform

Dates, movie minutes, TV seasons

4

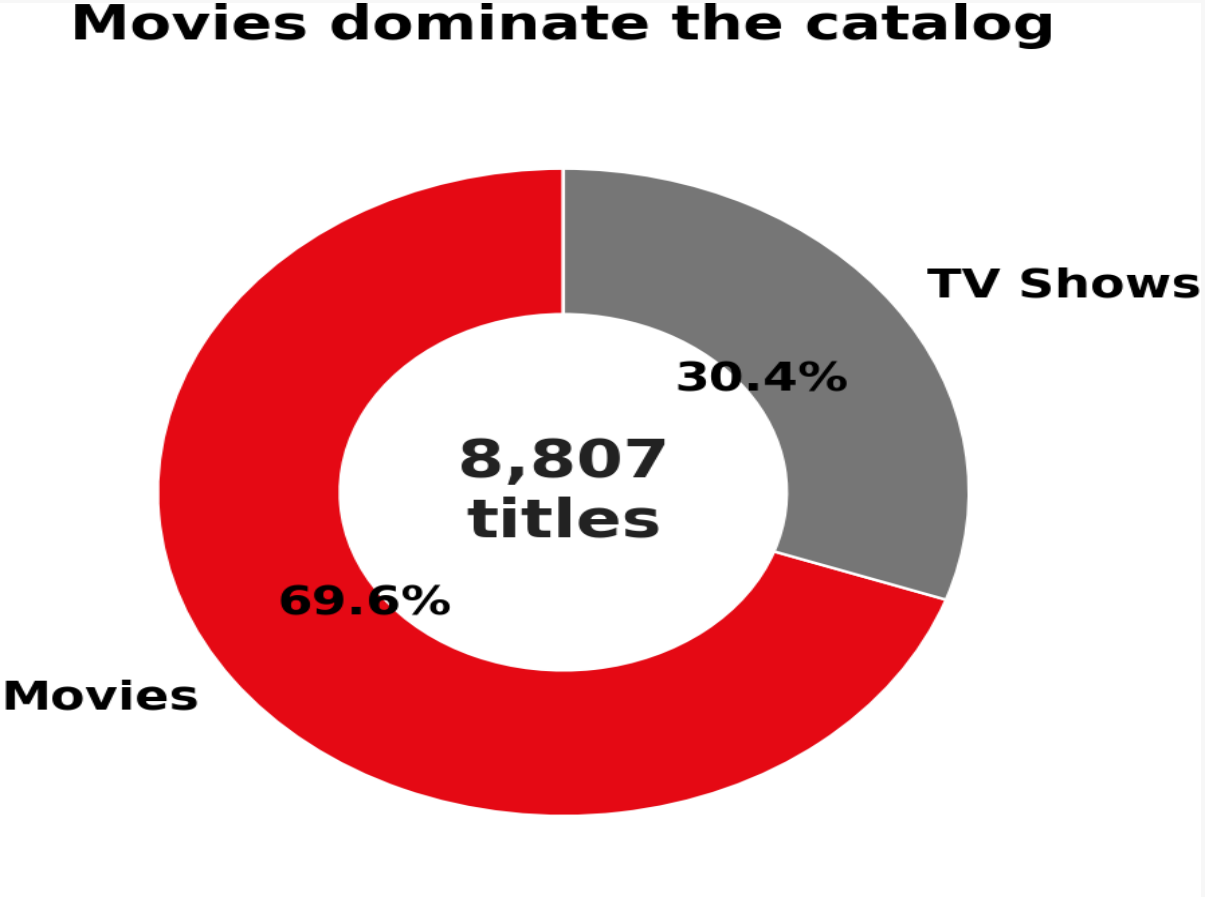

Analyze

IQR outliers, trends, categories

Key decision Outliers were flagged, not automatically deleted. Extremely short or long titles can be legitimate specials, documentaries, or extended features.

The catalog is movie-heavy

Movies represent roughly seven out of every ten titles in this historical snapshot.

6,131 movies

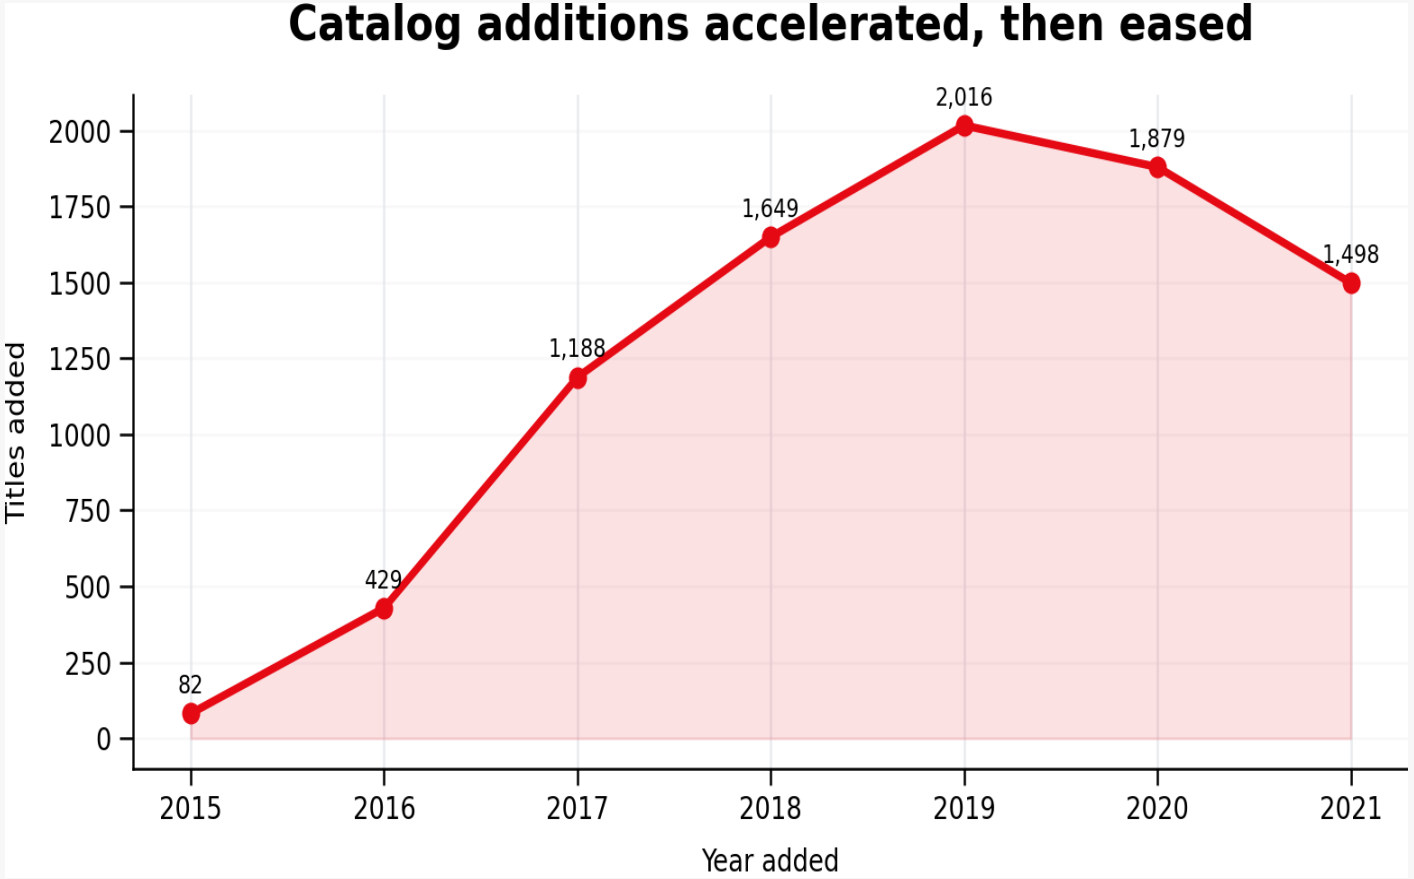

2,676 TV shows

Interpretation

This is a catalog-composition finding. It does not show that subscribers prefer movies.

Expansion peaked before the dataset ended

The catalog grew rapidly from 2016 through 2019; the final year is only a partial snapshot.

2019 peak

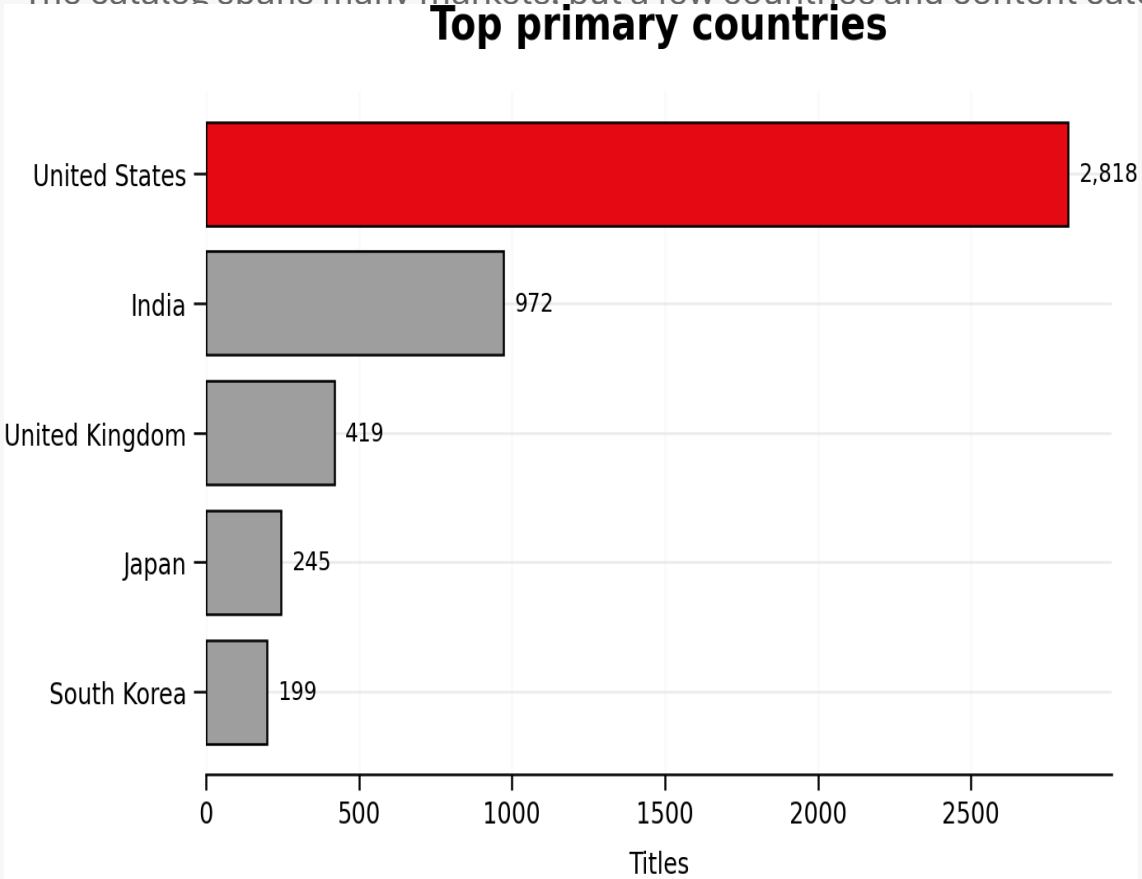

2,016 titles added

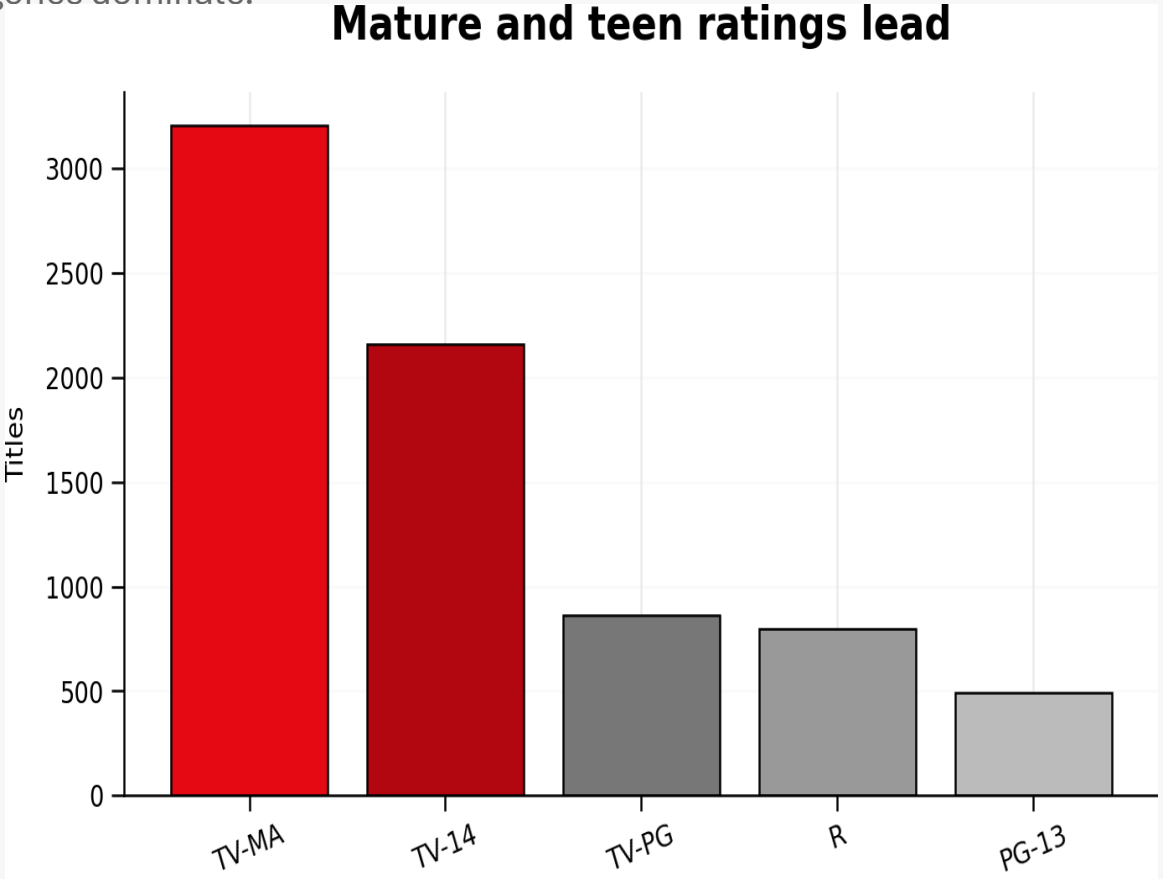

Caution

2021 should not be read as a full-year decline because records end in September.

Global reach, concentrated supply, mature audience mix

The catalog spans many markets, but a few countries and content categories dominate.

Genre context: International Movies, Dramas, and Comedies are the most frequent assignments.

What the analysis tells us

Four conclusions and three practical next steps.

1. **Movie-heavy catalog** — 69.6% of titles are movies.
2. **Rapid historical expansion** — Additions peaked in 2019.
3. **Global but concentrated** — The U.S. and India lead primary-country counts.
4. **Adult and teen orientation** — TV-MA and TV-14 dominate ratings.

Recommendations

- ✓ Analyze movies and TV shows separately because their duration measures differ.
- ✓ Split multi-value country and genre fields for more complete attribution.
- ✓ Combine catalog data with IMDb ratings or viewing metrics before making popularity decisions.

Bottom line: the dataset reveals catalog strategy, not customer preference.
